External applications via AutoCAD Web Services Plugin architecture Autodesk recently announced the release of a "Plugin Architecture" for AutoCAD 2010. AutoCAD 2010 and later versions use a plugin architecture for flexibility in the design and implementation of new features. AutoCAD plugin modules can be created using Visual Studio, or in other languages such as Python. Once a plugin module has been developed, it can be deployed to a design server where it can be tested and debugged. Once the plugin module has been properly tested, it can be packaged into an executable and deployed to a user's AutoCAD installation. These files will be installed as files on the user's hard drive. Any installed plugins can be disabled or deleted if a user desires. ObjectARX is to Autodesk Product Development what Microsoft.NET is to Microsoft Application Development. ObjectARX is a C++ class library that can be used for AutoCAD customization, enhanced drawing capabilities or Autodesk Inventor. It contains over 300 classes and 100 virtual function to make any application task easy. With ObjectARX, you can implement your own object logic or workflows, even in the existing environment. It has a strong structure with modern object model which makes your application elegant and extendible. A set of model-view-controller pattern has been implemented with ObjectARX to facilitate code reuse and make it easier to develop cross-platform applications. ObjectARX has been created to mimic most of the features of Autodesk's legacy applications, but it does not mean that you cannot use it in a newer version of AutoCAD. ObjectARX is different from LISP, VBA and Python plugins. LISP, VBA and Python are programming languages that allow applications to be written in the form of a program. ObjectARX a1d647c40b
