Licence: SolarWinds Virtualization Manager is the ideal tool to optimize vSphere and Hyper-V performance. It automates tasks that take up valuable time, and provides a centralized place for your administration activities. What is needed: The setup should be completed in the default location C:\Program Files\SolarWinds Virtualization Manager\install.log. I recommend using the XenServer version 6.5.0 or later. I recommend creating an account that will be used to access the administrative interface. For more information, see Creating an Administrator Account. I recommend using the default license key, license\_XenServer6\_5. I recommend using the minimum settings, i.e. if you only want to view the VMs, you don't need to add a resource pool or a tenant. You can remove these settings at the next step. I recommend using the wizard in the default setting. OPTIONAL: If you want to add an account for your host users to use the SolarWinds Virtualization Manager application on the Hyper-V server, then the following information can be added in the connection: User name for the SolarWinds Virtualization Manager application. Password for the SolarWinds Virtualization Manager application. Connection method. Either "Local" or "Remote" Connection type. Either "Sockets" or "Secure Sockets Layer (SSL)" IP address. This is the IP address of the Hyper-V server that should be used as the target for management activities. The following example will show how the connection can be created for an account: This setup includes Microsoft SQL Server 2012 and Microsoft SQL Server 2014. In order to install these, you need to enable the following features in Windows Features (in Control Panel): SQL Server 2012 Management Tools SQL Server 2014 Management Tools The setup includes a single login account to access the management interface of the SolarWinds Virtualization Manager application. This account will be used to view, edit and perform actions on the VMs. I recommend that a separate account be created in Active Directory for the administrator. This can be a local or domain account. I recommend that a password be set and that this be distributed to all host users. 77a5ca646e
