The new ergonomic gas pedal housing has an integrated, crash resistant battery. This makes it possible to store an energy-saving diesel fuel element in the accelerator pedal cable. The bi-material gearbox is the first one with this innovative technology. Together with the pedal housing, it is fully encapsulated and protected. Therefore, the risks of corrosion are almost eliminated. The stepless gearshift is adjusted by the driver with only one hand and the back seat driver can easily adjust the speed while driving. The model also offers a unique advantage, such as different colored stitching and stitching in special designs on the wheel covers and high-quality wheels with at least one finish system. See the entire catalogue on Audi. [Evolution of atrial fibrillation in heart transplantation. Multifactorial etiology]. Atrial fibrillation (AF) is the most common arrhythmia after heart transplantation (HT). Its incidence is significantly higher than in the general population. It continues to be a major problem after HT since its incidence increases with time. However, the factors that account for the increase in the incidence and prevalence of AF after HT are still unclear. To study the evolution and incidence of AF after HT, and to determine the factors associated with its development. We studied a cohort of 1,300 HT patients followed up at the Hospital das Clinicas (HC), University of São Paulo (FMUSP) and Instituto do Coração (IMC), Recife, in the period from January 2002 to September 2011. Data on patient characteristics and antiarrhythmic therapy were obtained from the HT database and electrocardiogram (ECG) records. Chronic AF was diagnosed using time-domain and frequency-domain parameters derived from ECG. During the follow-up period, a total of 1,092 (84.6%) had clinical arrhythmic events. Among these patients, 229 (20.9%) had AF. Fifty-six (25.4%) of them had chronic AF, which was significantly more prevalent (p=0.002) than the rest. In this group, the time interval between HT and diagnosis of AF was 6.2 years (12.3 months; 10.1-14.4) whereas in those patients who presented AF after 1 year of HT, the time interval was 6.9 years (12.9 months; 9.3-16.5). Both groups had similar pre- and post-transplant characteristics. 3e33713323
