Gorilla Glue Gorilla Glue is a brand of epoxy adhesive that is used for a variety of purposes. Its brand name and logo were created by Krazy Glue and is owned by 3M. Contents Overview Gorilla Glue is a brand of epoxy adhesive that is used for an assortment of purposes. Its brand name and logo were created by the 3M Corporation and is owned by the 3M Company. The product has been manufactured by the 3M Corporation since 1955, although it was originally created by the Krazy Glue Company. Gorilla Glue was originally developed for adhering items together, such as wood and clay. The adhesive can also be used as a wood glue, in metal working, and as a jointing or filling agent for cement. The product can be used for a number of other purposes as well. Gorilla Glue is water-based and is available in a selection of formulations. History Gorilla Glue was originally developed by Werner Cooperman for the purpose of adhering items together. It was later developed by Krazy Glue and the product was initially marketed as the Krazy Glue. Krazy Glue became a brand name and went on to become a famous brand. Krazy Glue has remained a strong brand name, despite losing the original Krazy Glue Company. The brand has experienced a decline in sales. The product has now been sold by the 3M Corporation for almost 50 years. It has remained popular throughout its history. Gorilla Glue is available in a wide variety of formulations. The adhesive is manufactured in several locations, although it is mostly manufactured in the US. The product is sold in many markets, including China, the United States, and Japan. The product has experienced a strong increase in sales, which has been explained by the increase in the number of people moving to and living in cities. Variants There are several different variants of Gorilla Glue. Some are more commonly used for different purposes. Some variants of the product include: Gorilla Glue FX: This type of glue has a more flexible consistency and is designed for use in jewelry and

The adsorption of ammonia on apatite and carbonate minerals has been studied by pH-stat titration, diffuse reflectance infrared Fourier transform spectroscopy and IR microscopy. The results indicate that ammonia is adsorbed by all phosphate minerals via chemisorption. The affinities for NH(3) are in the order: H(3)PO(4)>(CaHPO(4))(2) approximately brushite > CaCO(3)> apatite. In addition, IR spectroscopy has been used to determine the structure of adsorbed NH(3) on different apatite and carbonate minerals. It was found that the NH(3) is adsorbed on both the H- and OH-terminated surfaces, and the adsorption is accompanied with proton transfer from H to OH groups. The NH(3) adsorbed on both the H- and OH-termin

By using this OBD tool,you can take your work faster, so fgtech galletto 4-master software auto tune ecuObjective: The principal goal of this study was to evaluate the activity of doxorubicin (Dox) and etoposide (Etop) combinations with standard care for patients with relapsed and/or refractory Hodgkin's disease (HD).Methods: Single-agent Dox and Etop were administered to 87 patients (Group I). Combined Dox and Etop were administered to 75 of the patients (Group II). The 4-drug combination consisted of Dox, cyclophosphamide, vincristine and prednisone (CHOP). The 5-drug regimen consisted of Dox, vincristine, prednisone, doxorubicin (A) and cyclophosphamide (B). All patients received at least 3 weeks of radiation therapy to the primary site as well as the supraclavicular area. Non-responders and patients who had bulky disease or advanced stage disease received 2-4 courses of Dox and Etop chemotherapy.Response: The objective response rate (ORR) in patients receiving Dox and Etop was significantly lower than in patients who received CHOP chemotherapy (60% vs. 81.5%, p=0.02). However, the complete response (CR) rate in patients who received Dox and Etop was higher than in those who received CHOP (50% vs. 42.8%). There was no significant difference in relapse-free survival (RFS) between the 2 groups. The median RFS was significantly longer in patients with CR than in those with less than CR (64.2 vs. 34.2 months; p=0.0001). Treatment did not significantly affect survival. The 1-year and 2-year overall survival (OS) rates were 78% and 58% in Group I and 93.9% and 79.8% in Group II, respectively. Survival was significantly longer in patients receiving Dox and Etop who achieved CR than in non-responders (p=0.03). The median OS was significantly longer in patients who achieved CR compared with those without CR (82.8 vs. 54.1 months; p=0.0001). Toxicities
