This book is an introduction to Photoshop that assumes no prior experience with the program. This book assumes that you know how to use a computer mouse and the mouse button to select and move objects on the screen. I explain how to navigate the screen and get started with Photoshop in Book I Chapter 2. To prepare for this book, you need to know a bit about how Photoshop works and how to open a new document. ## Introducing the Basic Files in Photoshop After downloading Photoshop from Adobe (see the sidebar "How to buy Photoshop"), you first have to create a blank new document. You can do this in two ways: To create a new document, choose File⇒New. You see the New dialog box, where you specify the size of the new document and any image-editing tools that you want to add to the image. Click OK. You can start a new document by pressing the Ctrl+N keyboard shortcut. ## Saving, Printing, and Publishing Images Photoshop is available in three editions: Photoshop Creative Suite, Photoshop Elements, and Photoshop Creative Cloud. Photographers who already have a current version of Photoshop will need to download and install the newest edition. In addition to releasing updates that improve the program and add new features, Adobe also offers an option to subscribe to a service called Photoshop Creative Cloud (`www.adobe.com/products/photoshop-creative-cloud.html`), which enables you to share many of Photoshop's advanced features and keep up with the latest releases of Photoshop.

1. Field of the Invention This invention relates to an image display system used in, for example, a TV system, and more particularly to an image display system in which an image is displayed for a specified duration and an image is re-displayed after such a specified duration. 2. Description of the Related Art In an image display system, for example, in a TV system, generally, in order to display the next image after the screen is turned off, power is continuously supplied to a display and a next screen is reproduced on the screen. If power is supplied to a display at this time, the power consumption of the entire system is increased to a large extent. A light emitting element disposed in the back of the screen operates with even a small power. Therefore, the light emitting element is turned on so that the screen can be seen. Even if the screen is turned off, the display continues to operate and power is consumed by a driving circuit and the like in the same manner as in the case where the power is supplied to the display. The specification of Japanese Unexamined Patent Publication No. 4-80409, published in 1992, suggests the following image display method to reduce the power consumption of an image display apparatus. In the image display apparatus, in an image display period, an image is displayed on a display screen. At this time, the screen is turned off. After a specific time, the next image is displayed. The power supplied to the display at this time is consumed for a specific time and the next image is displayed. When the screen is turned off, the power supplied to the display is saved. When power is supplied to the display screen in the next image display period, the next image is displayed on the display screen.Estadio de Atenas The Estadio de Atenas is a sports stadium in the town of Atenas, Buenos Aires Province, Argentina. Primary Meningioma of the Temporal Artery: A Case Report and Review of the Literature. Primary meningioma of the temporal artery is extremely rare. The differential diagnosis of the meningioma includes angiosarcoma, aberrant meningioma, hemangiopericytoma, and rhabdomyosarcoma. Here, we report the case of a 55-year-old man who presented with headache. Computed tomography revealed an enhancing mass lesion in the anterior fossa of the left temporal region. Surgical resection was performed. Histopathological examination of the tumor showed psammoma bodies and immunohistochemical staining for pan-cytokeratin and epithelial membrane antigen was positive. At 10 months postoperatively, no recurrence has been observed.The role of preoperative high-dose-rate intracavitary brachytherapy in patients with locally advanced, intermediate-risk endometrial cancer. The objective of the current study was to determine the benefit of postoperative adjuvant chemotherapy (CT) and external-beam radiation therapy (EBRT) following high-dose-rate (HDR) intracavitary brachytherapy (ICBT) in patients with locally advanced, intermediate-risk endometrial cancer, in the absence of nodal metastasis, by comparing the outcome of women who received adjuvant CT and EBRT to those who did not. Women with FIGO Stage IIIA to IIIC, intermediate-risk endometrial cancer, no clinical nodal metastasis, and who underwent HDR-ICBT followed by EBRT (without or with concurrent CT) were identified from our institutional database. Outcomes were assessed by log-rank test and Cox regression analyses for relapse-free survival (RFS), overall survival (OS), and distant relapse-free survival (DRFS) to a median follow-up of 47 months. Of 261 patients with locally advanced, intermediate-risk endometrial cancer with complete pathologic data, 58 received adjuvant CT and 203 did not. Positive surgical margins, nonendometrioid histology, and FIGO Stage IV were significantly worse in the group that received CT. Among the patients who received CT, women with complete pathologic responses to primary therapy had excellent rates of 5-year RFS (90%), OS (84%), and DRFS (89%); among patients with incomplete pathologic responses, the 5-year
