"Steam Cleaner is a tiny application that promises to delete leftovers after uninstalling Steam games from a computer, in order to free up space."Q: Show that $a_m \to 0$ implies $\sum_{m=1}^\infty a_m$ converges Let $(a_m)_{m\in\mathbb{N}}$ be a sequence of real numbers. Show that $a_m \to 0$ implies $\sum_{m=1}^\infty a_m$ converges. I can see it's easy with the ratio test, since if $a_m\geq 0$ we have $$\left|\frac{a_{m+1}}{a_m}\right|\leq \left|\frac{a_{m+1}}{a_1+\cdots+a_m}\right|\leq\left|\frac{a_{m+1}}{a_1}\right|\leq \left|\frac{1}{2}\right|$$Once upon a time, there was a young man who hated the fact that the heroes of the stories he read did not satisfy the expectations he had of them. He decided to write his own story with heroes that satisfied his expectations. The story was published, the heroes inspired many authors to write their own stories, and the industry was born. The young man is a real person, I am speaking, of course, of me. This story describes how the media industry was born and why we should pay more attention to it.

Remove all leftovers after uninstalling Steam games from a PC in an instant Clean Steam, Origin, Uplay and GoG Galaxy leftovers Uninstall all games with Steam Cleaner and get rid of all leftover files in one go Uninstall all games installed on your PC and get rid of all leftovers in one goIn the field of optical signal processing, it is known that electro-optical components such as diffraction gratings, tilted gratings or free-space gratings can be employed, for example, for the conversion of an optical input signal into an optical output signal. For example, diffraction gratings, in the following referred to as "gratings", can be used for wavelength division multiplexing (WDM) optical add-drop multiplexers. For the purpose of coupling light into or out of a grating, a grating-coupling arrangement is known from U.S. Pat. No. 7,039,809 B2 and U.S. Pat. No. 7,914,950 B2, which involves coupling-in and coupling-out of the incident and the scattered light on the grating. A grating coupling arrangement is known from WO 2010/130542 A1, which is based on directing the incident and scattered light back to the grating. The grating coupling arrangements are usually constructed in the form of a grating-coupler element, which splits off a part of the incident beam for the light coupling-out. Various substrates, for example transparent materials such as silicon, are known for the fabrication of gratings. In addition, gratings can be realized on fiber-optic ribbons, which are clad with a cladding material, for example a glass material. In this respect, see Graziadei et al. "Dielectric Bragg gratings on Optical Fiber Ribbon Waveguides", Applied Physics B, 2006, 85: 307-311. However, fiber-optic ribbons and grating structures made thereon are difficult to handle and stabilize when being coupled into and out of an optical grating circuit. It is possible in a situation of this kind to connect the fiber-optic ribbon to the grating by means of refractive-index matching, i.e. adhesion and/or fusion, which makes it very difficult to provide freedom in the range of grating parameters, especially regarding the grating
