Drivers ("driver") driving support vehicles ("support vehicle") have become an increasingly important aspect of business. For example, certain drivers are working to load or unload a delivery (e.g., mail delivery) vehicle. These delivery vehicles typically have a greater height and often times a canopy is placed on top of the delivery vehicle to ensure the driver is protected from the weather. However, in many instances, the height of the delivery vehicle and the canopy make it difficult for a driver to see the destination address. Products that include ionic activity increase electrical potential in the presence of water. One of the simplest examples of an ionic activity product is chalk. Chalk contains charged particles, e.g., Ca^{2+} and CO_3^{2-} , which interact to form charged species, e.g., CaCO_3 , which have electrical potential. Chalk has been used for centuries to hold up buildings and to paint pathways. Even byproducts, e.g., calcium carbonate, are used in many industrial applications. In these applications, chalk is not held on any supports; these supports are simply used as a vehicle to transfer the ionic activity from chalky material to the environment. In addition, the electrical potential of chalky materials may be controlled by permeation of water through the chalky material, as water can react with CaCO_3 to form $\text{Ca}(\text{OH})_2$. The reaction produces an equivalent amount of protons (OH^- ion) and electrons (e^-) as the CaCO_3 . This makes the CaCO_3 more electropositive in the presence of water, thus producing an electrical potential. The external appearance of an object can be significantly c6a93da74d
