You can access Lightroom from anywhere on your computer. However, the familiar interface [that you should know] is found only in the file browser. What you see in the file browser is the Lightroom's Catalog—the Base level of information. If you need to look at the locations of all the photographs in your pictures, go to the Catalog. This is where you can look at every detail of your pictures, including the names of photographers, date, and location. As you look at the pictures, you can apply adjustments to them—and this is where you will find the presets. As you try out each preset, you will see how it has altered your pictures. In this article, you will learn about the Photo Library. This library is where all the pictures from your camera are stored. When you import the pictures from your camera into Lightroom, it automatically sorts them into groups based on the camera's location setting. Preview each group to see what the pictures look like and choose which ones to show in the Photo Browser. Have you noticed that every picture in Lightroom comes with a little bar showing the color of its main subject? If you click this bar and then click after you have finished the adjustment, you will see the effect on the picture in the photo browser. Currently, the only way to get to a Basic adjustment is to go to the Basic view and then click Tool, Basic adjustments. If you prefer to adjust your pictures on their own, then go to the Basic view and click the Color Chooser icon next to each color slider. In the Basic view, you can click the eyedroppers just next to the sliders to pick up the colors you see in the

picture. You can use this color information to adjust the colors in the picture. If you click on a color palette tool for a particular effect, like the gradients in this example, then you can adjust the brightness, contrast, and saturation of the gradient across the image.

Photon Based Image Decoding expands support for JPG, GIF, TIFF, PNG and PDF formats on Macs and Windows to allow users to open images in these formats that are saved on other post-production devices, or in other editing software, including the Photoshop Elements mobile app. There are a variety of advantages to this such as touching up images that have been cropped or adjusted and then being able to share them between devices, and users no longer have to deal with (or convert) images to their preferred formats of JPG, GIF, or TIFF before moving them back into Photoshop. “We’re listening to learn from our customers and partners about how we are providing the best possible Photoshop experience on all their devices. We’re excited to articulate this as is absolutely necessary.” “We’re not developing a back door into our technology as a way to sell more services,” said Shahram Izadi, product manager, Adobe. “We want to enable the best possible experience customers receive by working with the most reliable and predictable Post-Production workflow.” New tools bring the power of projection mapping to Photoshop, and the new interface is a great place to explore filter and

adjustment techniques. In addition to the image exporting functionality available in the Desktop version, the Photoshop Mobile App offers a number of features including: a flash-to-native workflow, the ability to share images at a resolution of up to 32-megapixels, photo tags, and the ability to upload images directly to social networks including Facebook and Twitter.
